

ABSTRACT OF THE DISCLOSURE

A light-emitting device comprising: a pair of electrodes formed on a substrate; and organic compound layers provided
5 in between the electrodes, wherein the organic compound layers comprises a light-emitting layer comprising a hole-transporting material and a phosphorescent compound and an electron-transporting layer comprising an electron-transporting material, and an ionization potential
10 of the electron-transporting material is 5.9 eV or more or wherein the organic compound layers comprises a hole-transporting layer comprising a hole-transporting material, a light-emitting layer comprising a phosphorescent compound and an electron-transporting layer comprising an
15 electron-transporting material, and an ionization potential of the electron-transporting material is 5.9 eV or more.
